

Return max option

```

def maxProfit(self, prices):
    n = len(prices)
    if n == 0:
        return 0
    option1 = maxProfit(prices[1:n], prices[1:n]) + 1
    option2 = maxProfit(prices[1:n], prices[1:n]) + 0
    option3 = maxProfit(prices[1:n], prices[1:n])
    return max(option1, option2, option3)

```

answer = 2 max of all option
